The oxidation state, sometimes referred to as oxidation number, describes the degree of oxidation (loss of electrons) of an atom in a chemical compound. Conceptually, the oxidation state, which may be positive, negative or zero, is the hypothetical charge that an atom would have if all bonds to atoms of different elements were 100% ionic, with no covalent component.

London dispersion forces (LDF, also known as dispersion forces, London forces, instantaneous dipole-induced dipole forces, or loosely van der Waals forces) are a type of force acting between atoms and molecules. They are part of the van der Waals forces. The LDF is named after the German-American physicist Fritz London

Make it a double: A method for the selective  $\alpha$ -dehydrogenation of amides in the presence of other carbonyl moieties under mild conditions has been developed. This strategy relies on electrophilic activation coupled to in situ selective selenium-mediated dehydrogenation. Mechanistic experiments suggest formation of an electrophilic Se IV species.

Molybdenum disulfide (MoS<sub>2</sub>) thin-film transistors were fabricated with ion gel gate dielectrics. These thin-film transistors exhibited excellent band transport with a low threshold voltage (<1 V), high mobility (12.5 cm<sup>2</sup>/(V·s)) and a high on/off current ratio (10<sup>5</sup>). Furthermore, the MoS<sub>2</sub> transistors exhibited remarkably high mechanical flexibility, and no degradation in the electrical ...

In general, polymers with a  $\text{R}_2\text{SiO}$  unit are termed silicones, while the  $\text{SiO}$  repeat unit is also called siloxane. The strength of the  $\text{SiO}$  bond gives the polymer its thermal and chemical stability, which is important for its use in high-temperature applications [1,2]. In PDMS, the flexibility of the siloxane backbone permits the chains to easily arrange and rearrange themselves so as to place ...
