Radioactive decay (also known as nuclear decay, radioactivity or nuclear radiation) is the process by which an unstable atomic nucleus loses energy (in terms of mass in its rest frame) by emitting radiation, such as an alpha particle, beta particle with neutrino or only a neutrino in the case of electron capture, or a gamma ray or electron in the case of internal conversion.

In nuclear physics and nuclear chemistry, a nuclear reaction is semantically considered to be the process in which two nuclei, or else a nucleus of an atom and a subatomic particle (such as a proton, neutron, or high energy electron) from outside the atom, collide to produce one or more nuclides that are different from the nuclide(s) that began the process.

Labs. Do "The Radioactive Decay of Pennium" lab, a half-life simulation using pennies. The "Radioactive Decay of Candium" is another half-life simulation but uses candy that students can then eat. The purpose of the "Alpha Please Leave Home" lab is to find the range of alpha particles and determine if the inverse square law applies. In the "Penetrating Power" experiment, students demonstrate the ...

As explained on pages 157-196, other heat sources are generating heat within the earth, so these thicknesses of granite would be even thinner. The granite crust is generally estimated to be at least 50 km (30 miles) thick. Therefore, steady state has not been reached.
